# Drupal & AngularJS

### DrupalCamp Spain 2014

Juampy Novillo Requena Mateu Aguilo Bosh

## About us (@e0ipso & @juampy72)

#### Drupal enthusiasts

**Developers at Lullabot** 

## Glossary (1)

#### Front end developer / Themer

Someone who works in the presentational aspects of a website.

#### **Back end developer / Programmer**

Someone who works in the architecture of a website.

## Glossary (2)

#### Decouple

*tr. separate, disengage, or dissociate (something) from something else.* 

For Drupal: move areas of business logic from Drupal to the client using JavaScript.

## **Backend: Drupal**

## **Client: Browser**

## ¿Why decoupling?

- 1. Theming in Drupal is tedious and tricky.
- 2. As an alternative to ESI in pages delivered by reverse proxies.
- 3. Easier core upgrades.

1. Theming in Drupal is tedious and tricky Hi themer! Here are hundred of thousands of divs; and the CSS is scattered among these files. Remember that if you touch core I will rip your head off. Good luck! :-D

#### Against ...

Hi themer, make a

request to the

service \$http('/mydata.json')

in JavaScript in order

to obtain the data.

You can write your own

CSS and HTML from

scratch.

# 2. As an alternative to ESI in pages delivered by reverse proxies

Given a page, allow that certain areas are dynamic but keep the rest been delivered by a <u>reverse proxy</u> like Varnish.

AngularJS fetches the data and renders the header.

Drupal + Varnish take care of the rest of the page.

Assync calls to different servers: - Data server - Server with the AngularJS app

## 3. Easier core upgrades

@daniel\_jacobson, ex CTO at National Public Radio (<u>www.npr.org</u>).

Built a backend system which offered an API to several client applications.

This backend system has been on for 12 years.

http://insready.com/sites/default/files/why\_need\_services.png

As long as we respect the structure of the APIs being consumed by client apps, the backend can evolve.

AngularJS is an MVC JavaScript framework which elegantly separates controller, business and model logic in your application.

## **AngularJS basics: directive**

A <u>Directive</u> is a marker on a DOM element that tell AngularJS's HTML compiler to attach a specified behavior to that DOM element.

http://jsfiddle.net/e0ipso/9eXD9/

## AngularJS basics (2): controller

A <u>Controller</u> is a JavaScript constructor function that is used to augment the Angular Scope.

http://jsfiddle.net/e0ipso/t2N8b/2/

The view can update the model and the model can update the view. Out of the box.

http://jsfiddle.net/e0ipso/PF3cP/1/

## ¿What about JQuery & Backbone?

There is no MVC separation as in AngularJS in JQuery and Backbone.

They both lack 2-way data binding.

Example in AngularJS / jQuery / Backbone.
